

Skill Map

This map places MDCS procedural closets and reference drawers on the IT-Business Analyst workflow axis. It serves as the index and overlap-detection catalog.

Procedures (Closets)

Workflow phase	Closet Prompt	Status	Consulted references	Overlap boundary
DB Intake & Diagnostics	<code>mock-data-generator</code>	proposed	<code>oracle-sql</code>	Generates schema-compatible mock datasets locally using compressed schemas. Excludes query tuning.
SQL Optimization	<code>query-tuner</code>	proposed	<code>oracle-sql</code>	Guides step-by-step query analysis and explain-plan evaluation. Excludes python scripting.
Python Reporting	<code>report-generator</code>	proposed	<code>python-idioms</code>	Handles pandas ETL and excel spreadsheet generation. Excludes direct Oracle schema generation.

References (Drawers)

Reference	Status	Topic Areas	Consuming closets
<code>oracle-sql</code>	proposed	Oracle SQL dialect, analytical functions, query tuning guidelines, mock tables	<code>query-tuner</code> , <code>mock-data-generator</code>
<code>python-idioms</code>	proposed	<code>oracledb</code> database integration, pandas data manipulation, <code>openpyxl</code> reporting	<code>report-generator</code>

Overlap Findings

- Healthy composition: `mock-data-generator` uses compressed schema output produced by `schema_compressor.py`.
- No forbidden overlaps: Procedural closets remain highly distinct (query optimization vs. python ETL generation vs. mock data generation).

Intentional MDCS Adaptations

- **Root-Level Folders:** In contrast to standard Aegis, procedures and references reside at the root of the workspace (`procedures/` and `references/`) for simplicity.
- **Two-Layer Scope:** We implement only the procedural and reference layers, intentionally omitting the role (Master, Worker, Validator) and operating discipline layers since this prompt library is used directly by a human.
